Summary

Computer Science graduate (2026) who enjoys building backend and distributed systems in Python. Looking for a software engineering role where I can build scalable, reliable cloud products and keep growing as an engineer.

Education

B.Tech, Computer Science (AI Specialization) | University of Lucknow 2022 - 2026

Technical Skills

- **Languages:** Python, Java, SQL
- **Core CS:** Data Structures & Algorithms, OOP, DBMS, Operating Systems, Computer Networks
- **Backend & Cloud:** FastAPI, REST APIs, PostgreSQL, Redis, Docker, AWS (Lambda, SageMaker, CDK), Cloudflare Workers
- **Testing & DevOps:** pytest, GitHub Actions, CI/CD, Git, Linux
- **AI-Assisted Development:** Claude, GitHub Copilot

Projects

Kario - Distributed Job Ingestion Engine | Python, FastAPI, Cloudflare Workers, PostgreSQL GitHub

- Built a **distributed ingestion pipeline** with custom connectors for **12+ ATS platforms** (Greenhouse, Lever, Workday, Ashby and more) that pulls live job postings from **200+ companies**.
- Turned messy job descriptions into structured data (experience range, batch eligibility, visa sponsorship), checked on every change by an **automated pytest suite** of labeled examples.
- Served it through an edge **REST API** on Cloudflare Workers with pooled **PostgreSQL** connections, keeping request CPU time **under 10 ms** by pushing filtering into SQL and de-duplicating content by hash.
- Automated discovery of new companies, smoke tests, and database migrations with **CI/CD** on GitHub Actions.

Real-Time Fraud Detection Platform on AWS | Python, AWS Lambda, SageMaker, CDK GitHub

- Built a **serverless, scalable cloud** scoring service on AWS Lambda and SageMaker, with all infrastructure defined in code using AWS CDK.
- Reached **97.7% AUC** on **50K+ transactions** (only 1 in 100 fraud) while keeping live predictions **under 200 ms at p99**.
- Automated retraining, validation, and deployment through **CI/CD**, with rolling deployments to avoid downtime.

Repliq - Secure Workflow Automation Platform | Python, FastAPI, Docker GitHub

- Built a **REST API** service in FastAPI that turns a screen recording into a workflow it can replay, completing a **20-step Salesforce process** end to end.
- Designed for **security and privacy**: real credentials kept in an encrypted vault, OAuth 2.0 access, and every task run in its own isolated **Docker** container.
- Debugged and fixed a bug where the system reported success while the task had failed, by checking the real page state after every step.

KARMA - Automated Code Optimization Pipeline | Python, FastAPI, Redis GitHub

- Built a pipeline that writes, tests, and benchmarks performance-critical code on its own, reaching up to **8.99× speedup**.
- Caught a false 40× result and wrote a four-stage **automated testing** harness that brought false positives to **0%**; cached build results in Redis to avoid repeated work.

Achievements & Certifications

- Solved **500+** Data Structures & Algorithms problems in Python.
- **Top 5 of 120+ teams**, IIT Madras Malware Analysis Hackathon.
- Agentic AI MOOC - UC Berkeley
- Machine Learning Specialization - IBM
